

Kwok Wai Kin (14) 4E & So Pak Lam (28)

The visit of Ma On Shan Sewage Treatment Works and the Chinese University of Hong Kong

In this photo, we can see that there are many different types of water produced during the process of cleaning the water. For example, filtered water, chlorinated water and treated water. In these processes, we could find a lot of interesting things which we don't know before. For instance, after filtering certain amount of dirty water, the materials which used for filtering may become dirty. I know how the dirty filter can be cleaned now. After the visiting, I have learnt many things for example the modern technology that use to clean the water and how does them work.

After visiting the Chinese University of Hong Kong. We can know more about the school life of undergraduates. They attend the class with different time and place since they study different subjects. They are free when they have no classes to attend. They can do exercise. Have a tea or go to library. After attending a talk, we can know more about the process of making a medicine. It has to spend a lot of money and time. We have also visited a chemistry lab to see a lot of machines that we have not seen before. The lab is so big which we can know many about the use of them.
