

Tang Tsz Ching (22) 6S

This photo shows the sampling pipes which is running out different samples. The samples are from different purifying stages. For instance, filter no. 1-6, filter no. 7-12, filter water and chlorinated water. Chlorinated water is the final product from the sewage plant. Water which is chlorinated is safer to drink as chlorine can sterilize the water. I have tried a cup of water from the chlorinated water pipe. The taste is a bit different from usual. It may due to the transporting process that the water contacts the transporting pipes which change the taste of water. Of course, boiled water is the safest to drink!
