Life-wide Learning Report

(A visit to Ma On Shan Sewage Treatment Plant
and the laboratories of CUHK)

It is my first time to visit sewage plant. I am surprised that how the water is treated for many processes before we drink. At home, we open the tap so we can get water. In the photos, the water in each tap represents the water in different procedures. Water is not as easy to get as we think. We should treasure every drop of water. This sewage plant has some green measures. For example, it reuses the sewage

that used in clearing the tanks. Some sewage is treated before discharged. All these measures are environmental friendly.

In the afternoon, we had a talk. The talk is about drugs and organic chemistry. I don't have study chemistry, but I think the content is quite interesting. However, I really don't understand the structure of the chemical as it is so complicated. After that, we visited the laboratory of CUHK. The laboratory is so big and beautiful. There are different apparatus. Although I know nothing about them, it's great for me to have a look on them.
