Genetically modified food

It has been debated from the past till now whether genetically modified food is inhumane or morally adoptable. From the visit to the Health Centre, I can find a thorough information about GM food. Such as its history, benefits to human, or its potential risks and how to make GM food. By those information, we can have our own judgment on whether we should invent GM food or not. As a science student, I will consider GM food as a solution to resolve the problem of food shortage. Since there are more and more underprivileged people in the third world who may not able to have enough food to maintain their lives. GM food can foster the yield of crops, so that there are plenty of food and it can be deliver to the starved people. However, I agree that it may be somewhat potential dangers which we may encounter in the future, but I think with the help of technology, the impact would be relieved.
