Topic: Genetically Modified Food

The genetically modified food is foods derived from genetically modified organisms. Genetically modified organisms have had specific changes introduced into their DNA by genetic engineering techniques. GM food can increase the yield of the crops and change the crops into can adapt to unfavorable growth conditions. Also, it can mix the genes of different crops together in order to produce new varieties of crops with different flavor. It can also change some characteristic of the crops and makes it easier to process to lower the production cost. On the other hand, the GM foods may have some effect on the health of human after eaten the food such as allergic reactions. It may harmful to the human body if the technique of making GM food is not fully mature. The society also concerned about the ethical issues of the GM food such that eating GM food is immoral. In conclusion, GM food is controversy such that it may greatly beneficial the human being if we can deal with the problem relating to it such as the ethical issues and the technique.
